# Aluminum Extrusions

MILL-FINISH, FABRICATED & ANODIZED – MOUNTAIN TOP, PENNSYLVANIA

**Hydro**

Hydro is a leading aluminum and energy company that builds businesses and partnerships for a more sustainable future. We develop industries that matter to people and society.

Since 1905, Hydro has turned natural resources into valuable products for people and businesses, creating a safe and secure workplace for our 32,000 employees in more than 140 locations and 40 countries.

Today, we own and operate various businesses and have investments with a base in sustainable industries. Hydro is present in a broad range of market segments for aluminum and metal recycling, and energy and renewables. We offer a unique wealth of knowledge and competence.

Hydro is committed to leading the way towards a more sustainable future, creating more viable societies by developing natural resources into products and solutions in innovative and efficient ways.

## LIMITATIONS

**Exclusions:** EPDs do not indicate that any environmental or social performance benchmarks are met, and there may be impacts that they do not encompass. LCAs do not typically address the site-specific environmental impacts of raw material extraction, nor are they meant to assess human health toxicity. EPDs can complement but cannot replace tools and certifications that are designed to address these impacts and/or set performance thresholds – e.g. Type 1 certifications, health assessments and declarations, environmental impact assessments, etc.

**Accuracy of Results:** EPDs regularly rely on estimations of impacts; the level of accuracy in estimation of effect differs for any particular product line and reported impact.

**Comparability:** EPDs from different programs may not be comparable. Full conformance with a PCR allows EPD comparability only when all stages of a life cycle have been considered. However, variations and deviations are possible. Example of variations: Different LCA software and background LCI datasets may lead to different results for upstream or downstream of the life cycle stages declared.

## 1. Product Definition and Information

### Description of Company/Organization

Through our unique combination of local expertise, global network, and unmatched R&D capabilities, Hydro can offer everything from standard profiles to advanced development and manufacturing for most industries. Hydro is committed to leading the way in shaping a sustainable future and in doing so, creating more viable societies by developing natural resources into products and solutions in innovative and efficient ways.

### Product Description

#### Product Identification

This EPD covers the production of mill-finished, fabricated and anodized profiles manufactured Hydro Extrusion North America located in Mountain Top, Pennsylvania, USA. The results are representative of the average mill finished, fabricated and anodized profiles manufactured with the average purchased billet. The input billet mix includes primary billets (from smelters) and secondary billets (from remelters). Secondary billets are the average cast billets manufactured by Hydro Extrusion in Cressona (Pennsylvania, USA) and Toronto (Canada)<sup>1</sup>. Table 1 represents a product description, whereas Figure 1 describes the production process.

Table 1 Product description

FIELD	VALUE
PRODUCT NAME	Aluminum extruded profile, including mill-finished, fabricated and anodized
PRODUCT DESCRIPTION	Mill-finished profiles, fabricated and anodized manufactured with the average purchased billet.
CLASSIFICATION	Semi-fabricated construction product
CLASSIFICATION (SEMI-FABRICATED PRODUCTS ONLY)	List the raw material inputs: aluminum billet Output: extruded profile, fabricated profile
FINISHING	Machining and anodizing
ALLOY GROUP	6000 series

<sup>1</sup> Declaration number 4790427057.101.1 for Cressona, number 4790427057.132.1 for Toronto

ISO 21930:2017

## Declaration of Methodological Framework

This EPD is declared under “cradle to gate with options” system boundaries. As such, it includes A1-A3, C1-C4 and D modules.

## Material Composition

The type of aluminium alloys and their chemical composition is reported in Table 2, whereas the main product materials that make up the product are described in Table 3. No substances required to be reported as hazardous are associated with the production of this product.

Table 2: Types of Aluminum, as per teal sheet (AA, 2018)

DESIGNATION AND CHEMICAL COMPOSITION LIMITS																	
	Si	Fe	Cu	Mn	Mg	Cr	Ni	Zn	Ti	B	Bi	Pb	Sn	V	Zr	Others Each	Aluminum

ISO 21930:2017

Tensile strength RM min	260	N/mm <sup>2</sup>
Tensile Stress at Break	12	%

## Manufacturing

The extrusion process takes cast billet and produces extruded profiles by means of electricity driven presses. The preparation for extrusion begins with a calibrated furnace that preheats the temperature of the billet to a predetermined level depending on the alloy. During cut to length process, the billet is sheared and placed in a hydraulic press, which then forces the billet through a heated steel die to form the desired shape. The length of the resulting extrusion is dictated by the cut off process. Extrusions are air cooled, or water quenched, to specific quench parameters dependent on the alloy and desired properties. The extrusion is then secured and stretched to straighten the profile and relieve tension. Subsequently, the stretched profile is cut to length and then aged at elevated temperatures to achieve desired hardness properties. During the aging process, a restructuring of the atomic structure occurs to improve the mechanical strength of the product.

Upon completion of the aging process, profiles may be staged for shipment or be transferred for fabrication and /or anodizing.

## Packaging

It was not possible for the facility to account for packaging materials used for billets and packaging materials used for profiles produced in the same site. To avoid double counting of packaging impacts, total amount of packaging materials entering the site are allocated to the total amount of products output from the whole set of production lines. Wood, plastic, cardboard, paper and metal are used in the site. Table 5 reports the amount allocated to 1 kg of aluminum product in output.

Table 5: Primary packaging per declared unit

TYPE OF PACKAGING	AMOUNT PER DECLARED UNIT (KG/KG)
WOOD PACKAGING PURCHASED	1.45E-02
PLASTIC PURCHASED	5.35E-04
CARDBOARD PURCHASED	1.83E-02
PAPER PURCHASED	4.59E-03

## Recycling and disposal

Aluminum is 100% recyclable and can be recycled repeatedly. Basically, in building and construction, aluminum has a recycling rate of 95% (UNEP, 2011), meaning that 95% of the collected aluminum is recycled, the remaining 5% is lost in the pretreatment process. Conservatively, it is assumed that only 94% of the aluminum reaching the end of life is collected. Aluminum not collected and aluminum lost in the pretreatment process is sent to landfill.

ALUMINUM EXTRUSIONS  
MILL-FINISH, FABRICATED & ANODIZED – MOUNTAIN TOP, PENNSYLVANIA

According to ISO 14025 and  
ISO 21930:2017

## 2. Life Cycle Assessment Background Information

### Functional or Declared Unit

The declared unit of this EPD is 1 kg of aluminum profile.

### System Boundary

This EPD is cradle to gate with optional modules (as presented in Table 6). Modules A5 and B1 to B7 are excluded as they are strongly dependent on the specific application within the reference market.

The following stages are included in the study:

- **Raw Materials supply (A1).** Production of raw materials used in the products. A1 includes:
  - Production of billets
  - Production of wet paint (for painted profile)

The production of energy carriers used in the production process is part of A1 as well.

- **Transport of materials (including ancillary) to the factory (A2)**
- **Manufacturing of the Hydro aluminum profiles (A3).** It includes the following production phases:
  - Cutting of billets and pre-heating of billets and dies
  - Extrusion, including cooling, stretching and cutting and aging
  - Anodizing (if applied)
  - Packaging and storage for shipping

In module A3, the production of primary packaging, of the ancillary materials and the treatment of waste generated from the manufacturing processes are accounted for. Since module A5 is excluded, the CO<sub>2</sub> stocked in the packaging has been balanced with an equal emission of CO<sub>2</sub>.

- **Deconstruction (C1)** – demolition processes
- **Transport (C2)** – Transport to waste processing and to disposal
- **Waste processing (C3)** – shredding and sorting of aluminum collected at deconstruction step
- **Disposal (C4)** – Landfill of fractions lost in C1 and C3
- **Reuse, recovery and recycling potential (D)** – transport to remelting site, remelting and avoided primary production.

X	X	X	MND	MND	MND	MND	MND	MND	MND	MND	MND	X	X	X	X	X

X= Module included in the EPD; MND= Module not declared

**Estimates and Assumptions**

All the raw materials and energy input have been modeled using processes and flows that closely follow actual production data on raw materials and processes. All reported raw materials and energy flows have been accounted for. No known raw materials and energy flows are deliberately excluded from the present EPD.

**Cut-off Criteria**

Packaging of some specific chemicals are not accounted for. The construction of the manufacturing site is excluded as well. In cases where no matching life cycle inventory are available to represent a flow, proxy data have been applied based on conservative assumptions.

**Data Sources**

The LCA model was created with the support of *LCA for Experts v. 10.8.0.14 software and Database MLC version 2023.2.*

Primary aluminum production datasets from the International Aluminium Institute (IAI) have been used to represent the primary billets used in the profile production and purchased in United States and Middle East.

The resulting carbon intensity associated to the primary billet entering the plant is reported in Table 7.

Table 7 Primary material, recycled material, and smelting data

DATASETS USED IN THE CALCULATION	CARBON INTENSITY OF ELECTRICITY (KG CO <sub>2</sub> /KWH)	WEIGHTED AVERAGE POWER MIX (%)	GEOGRAPHIC ORIGIN

According to ISO 14025 and  
ISO 21930:2017

		Natural gas 8% Nuclear 1%	
RME: Aluminum ingot mix IAI			Middle East

As far the secondary billets is concerned, those from Hydro Cressona and Toronto do consider the information as declared in the related EPD<sup>2</sup>.

### Data Quality

Specific data for the modeling of the manufacturing phase were collected at the Hydro manufacturing site for the reference year.

The majority of the generic data used in the study comes from Sphera’s database, which has updated all its processes to 2022 data. Therefore, the study is in line with the ISO 21930 requirements on the time representativeness of the selected generic data (not older than 10 years).

### Period under Review

Primary data were collected for Hydro’s manufacturing processes over the 12 months of the 2022 calendar year. Background data for upstream and downstream processes were obtained from the *LCA for Expert Database, MLC version 2023.2*.

### Allocation

The allocation is made in accordance with the provisions of ISO 21930. Energy and resources (water and ancillary) inputs, waste and emissions outputs from the manufacturing processes are allocated to the final product based on mass.

## 3. Life Cycle Assessment Scenarios

Table 8. End of life (C1-C4)

NAME		VALUE	UNIT
Assumptions for scenario development (description of deconstruction, collection, recovery, disposal method and transportation)		See Recycling and Disposal in section 1	
Collection process (specified by type)	Collected separately	0.912	kg
	Collected with mixed construction waste	0.088	kg
Recovery (specified by type)	Reuse	-	kg
	Recycling	-	kg
	Landfill	0.531	kg

<sup>2</sup> Declaration number 4790427057.101.1 for Cressona, number 4790427057.132.1 for Toronto

# Environmental Product Declaration

ALUMINUM EXTRUSIONS  
MILL-FINISH, FABRICATED & ANODIZED – MOUNTAIN TOP, PENNSYLVANIA

According to ISO 14025 and  
ISO 21930:2017

	Incineration	0.088	kg
	Incineration with energy recovery	-	kg
	Energy conversion efficiency rate	-	
Disposal (specified by type)	Product or material for final deposition	0.088	kg
Removals of biogenic carbon (excluding packaging)		-	kg CO <sub>2</sub>

The transport distance between the demolition site and the landfill is assumed to be 100 km. Similarly, the transport distance between the preprocessing site and the landfill and between the demolition site and the preprocessing site is assumed to be 100 km.

## Benefits and loads beyond the system boundaries (D)

The values in Module D include a recognition of the benefits or impacts related to aluminum recycling which occur at the end of the product's service life. Such recognition includes the transportation, where a distance of 100 km is assumed between the preprocessing site and the remelting site. The rate of aluminum recycling and related processes are expected to evolve over time. The results included in Module D attempt to capture future benefits, or impacts, but are based on a methodology that uses current industry-average data reflecting current processes.

Values in Module D are calculated based on a net scrap approach, based on recycled content resulting from Table 3 and recycling rate resulting from Table 8, and re-called in Table 9. Datasets in Table 10 were used for the calculation.

Table 9. Recycling rate and recycled content of the products

NAME	VALUE FOR MILL FINISHED	VALUE FOR FABRICATED	VALUE FOR ANODIZED	UNIT
Recycling rate of the product	91.20%	91.20%	91.20%	%
Recycled content of the product	11.4%	11.4%	11.4%	%

Table 10 benefits and loads beyond the system boundary (D), relevant scenario information

BACKGROUND DATASETS	REFERENCE YEAR
RNA: Recycled aluminum ingot (100% recycled content)	2016
RNA: Primary aluminum ingot	2016

The net scrap approach is based on the perspective that the material recycled into secondary material at the end of life will replace an equivalent amount of virgin material. Hence, a credit is given to account for this material substitution.

However, this also means that a burden should be assigned to scrap used as input to the recycling process. This approach rewards the end of life recycling but does not reward the recycled content.

ALUMINUM EXTRUSIONS

According to ISO 14025 and  
ISO 21930:2017

## 4. Life Cycle Assessment Results

### Life Cycle Impact Assessment Results

#### **Comparability:**

Environmental declarations from different programs based upon differing PCRs may not be comparable.

Comparison of the environmental performance of construction works and construction products using EPD information shall be based on the product's use and impacts at the construction works level. In general, EPDs may not be used for comparability purposes when not considered in a construction works context. Given this PCR ensures products meet the same functional requirements, comparability is permissible provided the information given for such comparison is transparent and the limitations of comparability explained.

When comparing EPDs created using this PCR, variations and deviations are possible. Example of variations: Different LCA software and background LCI datasets may lead to different results for upstream or downstream of the life cycle stages declared.

Comparisons cannot be made between product-specific or industry average EPDs at the design stage of a project before a building has been specified. Comparisons may be made between product-specific or industry average EPDs at the time of product purchase when product performance and specifications have been established and serve as a functional unit for comparison. Environmental impact results shall be converted to a functional unit basis before any comparison is attempted.

Any comparison of EPDs shall be subject to the requirements of ISO 21930. EPDs are not comparative assertions and are either not comparable or have limited comparability when they have different system boundaries, are based on different product category rules or are missing relevant environmental impacts. Such comparison can be inaccurate and could lead to erroneous selection of materials or products which are higher impact, at least in some impact categories.

## Alternative life cycle assessment results

The following section reports the calculated LCIA indicators when considering process scrap (industrial scrap) as a co-product. In this approach, the process scrap in output from the extrusion (and further processing) takes the same material burden of the billet in input to the extrusion. Similarly, the process scrap entering the billet production takes the same burden of the original billet used in the production process which generated the scrap. The LCIA results are reported in Tables 23-25.

## 5. LCA Interpretation

The present interpretation is intended to provide further information in support of results reported in Table 11 -13.

The LCA study shows that the higher contribution to the overall impacts comes from the manufacturing stage (around 90% for analysed impact categories), whereas the downstream (C1-C4) is of minor relevant (around 3%).

With regard to the upstream stages, impacts are driven by billets for all impact categories, with the exception of the ODP for fabricated and anodized profiles where the first contributor is the fabrication (for fabricated profiles) or anodizing (for anodized profiles), due to the electricity used in the process. The relative contribution of the different processes to the

ALUMINUM EXTRUSIONS

According to ISO 14025 and  
ISO 21930:2017

upstream stage (A1-A3) are reported in Figures 2-4.

Figure 2: Relative contribution of upstream processes for mill-finished profile

## 6. Additional Environmental Information

### Environment and Health During Manufacturing

The entire manufacturing process is monitored by management systems certified to ISO 9001 and IATF 16949, with regard to quality-related product requirements. All statutory obligations with regard to occupational and workplace safety and the environment have been complied with throughout the entire manufacturing process. This is ensured by management systems certified to ISO 14001 and ISO 45001 which are continuously monitored internally and by external accredited certification bodies.

### Environment and Health During Installation

All statutory obligations with regard to occupational and workplace safety and the environment have been complied with throughout the entire manufacturing process. This is ensured by management system certifications to ISO 14001 and ISO 45001 which are continuously monitored internally and by external accredited certification bodies.

### Environmental Activities and Certifications

Hydro Extrusion North America maintains corporate certification to ISO 9001, IATF 16949, ISO 14001, ISO 45001 and the ASI performance standard.

### Further Information

See <https://www.hydro.com/> for further information.

ALUMINUM EXTRUSIONS  
MILL-FINISH, FABRICATED & ANODIZED – MOUNTAIN TOP, PENNSYLVANIA

According to ISO 14025 and  
ISO 21930:2017
